

National Artificial Intelligence Risk Management Framework

بِسْمِ اللَّهِ الرَّحْمَنِ الرَّحِيمِ

Executive Summary

Artificial intelligence (AI) today represents one of the key enablers in the development of business and government and private-sector services, given the advanced capabilities it provides in analysis, decision-making, and data use. Alongside these opportunities, a range of risks emerges in the design, operation, and governance of AI systems, with potential implications for individuals, entities, and the national economy. This requires well-defined frameworks to manage these risks and mitigate their potential consequences.

Common risks associated with AI include privacy, fairness and bias, ethics, regulatory compliance, and cybersecurity. Addressing these risks systematically is a fundamental requirement for ensuring the reliability of AI solutions, protecting individuals' rights, and strengthening trust in AI-powered services. In line with the Kingdom of Saudi Arabia's ambition to maximize the benefits of data and AI in support of the objectives of Saudi Vision 2030, there is a clear need to adopt a national framework for AI risk management that keeps pace with the expanding adoption of these technologies and supports the application of governance and compliance principles, as well as adherence to relevant ethical and regulatory standards. This framework supports the National Strategy for Data and AI and complements efforts aimed at achieving durable economic and social benefits based on the responsible and safe use of technology.

The Saudi Data and Artificial Intelligence Authority (SDAIA) issues this advisory framework for AI risk management in government and private-sector entities in its capacity as the national authority for data and AI. The framework is grounded in the regulatory arrangements of the Authority issued by Council of Ministers Resolution No. (292), dated 1441/4/27 AH, which stipulate that the Authority is the national reference for all matters related to data — including big data — and AI in terms of regulation, development, supervision, and integration. The framework aims to provide entities with a practical methodology for identifying, assessing, treating, and monitoring AI risks, thereby supporting the direction of technology investments on informed foundations, ensuring high levels of safety and reliability, and strengthening the Kingdom's position in adopting leading and responsible practices in AI.
